

Project 2: Website UI Redesign

Student Name: Jaymendrasinh

Roll Number: IT006

Date: 13 May 2026

Website: College Canteen Ordering System

1. Problem Statement

Our college canteen website takes 5+ minutes to order during a 15-minute break. Students avoid it due to poor Visual Hierarchy, Layout Design, and Responsive Design. My goal: redesign it for 1-minute ordering.

2. 5 Key Usability Issues Found

Issue 1: No Visual Hierarchy

Problem: "Order Now" button is too small. Users confused where to click first.

My Solution: Make "Order Now" biggest, Orange #FF7A00 button at top.

Issue 2: Not Mobile Responsive

Problem: Website needs horizontal scroll on 390px mobile. Text gets cut off.

My Solution: Design mobile-first 390px frame. Remove horizontal scroll.

Issue 3: Slow Loading

Problem: Menu takes 12 seconds to load because of heavy images.

My Solution: Compress images. Target 3 second load time.

Issue 4: No Search/Filter

Problem: Students scroll 40+ items to find food. No Veg/Jain filter.

My Solution: Add search bar + "Veg", "Under ₹50" filter chips.

Issue 5: No Order Feedback

Problem: Cart shows no badge. No token number after payment.

My Solution: Add cart badge "1". Show "Token T-42" on success page.

3. How My Redesign Fixes This

1. Visual Hierarchy: Primary CTA will be 200x56px orange button to guide user attention.

2. Layout Design: Use 12-column grid. Consistent header with Logo left, Search center, Cart right.

3. Responsive Design: Create Desktop 1440px + Mobile 390px versions with same features.

This reduces ordering time from 5 minutes to under 1 minute.

4. Conclusion

Current website fails basic usability. My redesign focuses on the 3 key outcomes from the brief: Visual Hierarchy, Layout Design, and Responsive Design to make ordering fast and easy for students.
